

# The *Amazing* Raindrop

All living things must have water. Water falls from the sky as rain or snow. Rain helps the plants to grow, and it flows into lakes and streams. Streams and rivers flow into the ocean, and along the way, plants and animals absorb and drink the water. Water evaporates and returns to the sky. This cycle is called the water cycle.

Below is a maze which follows the journey of a raindrop through the water cycle. See if you can travel all the way from **start** to **finish**
